

TTE-DR diagnostic snapshot

Scenario S18 | causal null | well specified

Red

Dominant flags

high_pressure; high_cum_pressure; extreme_signal

Pressure

max |SPD(t)| = 0.951
end pressure = 2.452

Positivity

min rESS = 0.903
max tail share = 0.027

Stability

logRR range = 0.106
direction change = note

Sensitivity

delta* = >2.0; no tipping within range

Template interpretation

Diagnostics indicated substantial fragility; decision-grade conclusions were not supported under the pre-specified QA panel. The estimated effect direction changed across reasonable specifications. Selection pressure increased over follow-up, suggesting prognosis-dependent deviation.

Direction change across specifications is reported as an informational note.
